John Tukey’s stem-and-leaf plot first appeared in 1970. Although very useful back then, it cannot handle more than 300 data points and is completely text-based. Stemgraphic is a very easy to use python package providing a solution to these limitations.

A typical stem_graphic output:

```
Key: aggr|stem|leaf

```

For an in depth look at the algorithms and the design of stemgraphic, see

A PDF version of the documentation is available at: http://stemgraphic.org/doc/stemgraphic.pdf

The official website of stemgraphic is: http://stemgraphic.org
Stemgraphic requires docopt, matplotlib, pandas and seaborn. Optionally, having Scipy installed will give you secondary plots, cufflinks for interactive plots and Dask (see requirements_dev.txt for all needed to run all the functional tests) will allow for out of core, big data visualization.

If you use conda, it is recommended you conda install docopt, matplotlib, pandas, seaborn, and scipy before doing a pip install of stemgraphic.

Installation of stemgraphic is simple:

```
    pip3 install -U stemgraphic
```

or from a clone of the github repository, in the package root:

```
    python3 setup.py install
```
STEMGRAPHIC QUICKSTART WITH NUMBERS

Import stem_graphic from stemgraphic (shortcut) or explicitly from stemgraphic.num.

In [1]: %matplotlib inline
   import pandas as pd
   from stemgraphic import stem_graphic

Load a data frame

In [2]: df = pd.read_csv('..//iris.csv')
In [3]: df.describe()

Out[3]:

<table>
<thead>
<tr>
<th></th>
<th>count</th>
<th>sepal_depth</th>
<th>sepal_width</th>
<th>petal_depth</th>
<th>petal_width</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>150.000000</td>
<td>150.000000</td>
<td>150.000000</td>
<td>150.000000</td>
<td></td>
</tr>
<tr>
<td>mean</td>
<td>5.843333</td>
<td>3.054000</td>
<td>3.758667</td>
<td>1.198667</td>
<td></td>
</tr>
<tr>
<td>std</td>
<td>0.828066</td>

</tbody>
</table>

Select a column with text.

In [4]: stem_graphic(list(df['species'].values));

From this, we see we have 50 setosa, 50 versicolor and 50 virginica, but you probably already knew that!
Import stem_graphic from stemgraphic.alpha

In [2]: %matplotlib inline
   from stemgraphic.alpha import stem_graphic

Load words from a text file on disk.

In [3]: stem_graphic('/usr/share/dict/american-english');
INCLUDED STOP WORDS

In [1]: from stemgraphic.stopwords import EN, FR, ES, ALT_EN

Very short list of English stop words

In [2]: len(ALT_EN)
Out[2]: 27

In [3]: print(ALT_EN)
['a', 'am', 'an', 'and', 'are', 'as', 'at', 'been', 'for', 'from', 'in', 'is', 'of', 'on', 'or', 'out', 'that', 'the', 'these', 'this', 'those', 'to', 'upon', 'was', 'were']

The French and Spanish stop words are quite similar, but Spanish has several gender specific words (i.e. quelque vs. algun, algunos, algunas) so it is larger.

In [4]: len(FR)
Out[4]: 127

In [5]: len(ES)
Out[5]: 183

The main English stop word list is significantly larger.

In [6]: len(EN)
Out[6]: 316
Fig. 7.1: Stem-and-Leaf plot with numbers (salaries)
Fig. 7.2: Back-to-back stem-and-leaf plot comparing two text files (Sherlock Holmes stories)

Fig. 7.3: Stem-and-leaf heatmap
Fig. 7.4: Stem-and-Leaf plot from a list of words
Fig. 7.5: Stem-and-Leaf plot styled as a histogram (with stem binning)
8.1 stemgraphic

stem_graphic

Package implementing a complete toolkit for text and a graphical stem-and-leaf plots and other visualizations adapted to stem-and-leaf pair values, such as heatmaps and sunburst charts.

It also handles very large data sets through scaling, sampling, trimming and other techniques.

See research paper (http://artchiv.es/pydata2016/stemgraphic) for more technical details.

A command line utility was installed along with the package, allowing to process excel or csv files. See: stem -h

8.2 aliases

Handy aliases for stem_graphic options.

stemgraphic.aliases.stem_hist(x, aggregation=False, alpha=1, asc=True, column=None, color='b', delimiter_color='r', display=300, flip_axes=True, legend_pos='short', outliers=False, trim=False)

stem_hist builds a histogram matching the stem-and-leaf plot, with the numbers hidden, as shown on the cover of the companion brochure.

Parameters

- legend_pos –
- x – list, numpy array, time series, pandas or dask dataframe
- aggregation – Boolean for sum, else specify function
- alpha – opacity of the bars, median and outliers, defaults to 15%
- asc – stem sorted in ascending order, defaults to True
- column – specify which column (string or number) of the dataframe to use, else the first numerical is selected
- color – the bar facecolor
- delimiter_color – color of the line between aggregate and stem and stem and leaf
- display – maximum number of data points to display, forces sampling if smaller than len(df)
- flip_axes – X becomes Y and Y becomes X
stemgraphic Documentation, Release 0.6.1

- **outliers** – this is NOP, for compatibility
- **trim** – this is NOP, for compatibility

**Returns** matplotlib figure and axes instance

```python
stemgraphic.aliases.stem_kde(x, **kw_args)
```

stem_kde builds a stem-and-leaf plot and adds an overlaid kde as secondary plot.

**Parameters**

- **x** – list, numpy array, time series, pandas or dask dataframe
- **kw_args** –

**Returns** matplotlib figure and axes instance

```python
stemgraphic.aliases.stem_line(x, aggregation=False, alpha=0, asc=True, column=None, color='k', delimiter_color='r', display=300, flip_axes=True, outliers=False, secondary_plot=None, trim=False)
```

stem_line builds a stem-and-leaf plot with lines instead of bars.

**Parameters**

- **x** – list, numpy array, time series, pandas or dask dataframe
- **aggregation** – Boolean for sum, else specify function
- **alpha** – opacity of the bars, median and outliers, defaults to 15%
- **asc** – stem sorted in ascending order, defaults to True
- **column** – specify which column (string or number) of the dataframe to use, else the first numerical is selected
- **color** – the color of the line
- **delimiter_color** – color of the line between aggregate and stem and stem and leaf
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **flip_axes** – X becomes Y and Y becomes X
- **outliers** –
- **secondary_plot** – One or more of ‘dot’, ‘kde’, ‘margin_kde’, ‘rug’ in a comma delimited string or None
- **trim** – this is NOP, for compatibility

**Returns** matplotlib figure and axes instance

### 8.3 alpha

stemgraphic.alpha.

BRAND NEW in V.0.5.0!

Stemgraphic provides a complete set of functions to handle everything related to stem-and-leaf plots. alpha is a module of the stemgraphic package to add support for categorical and text variables.

The module also adds functionality to handle whole words, beside stem-and-leaf bigrams and n-grams.

For example, for the word “alabaster”: 
With **word_** functions, we can look at the word frequency in a text, or compare it through a distance function (default to Levenshtein) to other words in a corpus

With **stem_** functions, we can look at the fundamental stem-and-leaf, stem would be ‘a’ and leaf would be ‘l’, for a bigram ‘al’. With a stem_order of 1 and a leaf_order of 2, we would have ‘a’ and ‘la’, for a trigram ‘ala’, so on and so forth.

**stemgraphic.alpha.add_missing_letters** *(mat, stem_order, leaf_order, letters=None)*

Add missing stems based on LETTERS. defaults to a-z alphabet.

**Parameters**

- **mat** – matrix to modify
- **stem_order** – how many stem characters per data point to display, defaults to 1
- **leaf_order** – how many leaf characters per data point to display, defaults to 1
- **letters** – letters that must be present as stems

**Returns** the modified matrix

**stemgraphic.alpha.heatmap** *(src, alpha_only=False, annotate=False, asFigure=False, ax=None, caps=False, compact=True, display=None, interactive=True, leaf_order=1, leaf_skip=0, random_state=None, stem_order=1, stem_skip=0, stop_words=None)*

The heatmap displays the same underlying data as the stem-and-leaf plot, but instead of stacking the leaves, they are left in their respective columns. Row ‘a’ and Column ‘b’ would have the count of words starting with ‘ab’. The heatmap is useful to look at patterns. For distribution, stem_graphic is better suited.

**Parameters**

- **src** – string, filename, url, list, numpy array, time series, pandas or dask dataframe
- **alpha_only** – only use stems from a-z alphabet
- **annotate** – display annotations (Z) on heatmap
- **asFigure** – return plot as plotly figure (for web applications)
- **ax** – matplotlib axes instance, usually from a figure or other plot
- **caps** – bool, True to be case sensitive
- **compact** – remove empty stems
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **interactive** – if cufflinks is loaded, renders as interactive plot in notebook
- **leaf_order** – how many leaf characters per data point to display, defaults to 1
- **leaf_skip** – how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: ‘wol’,’wor’,’woo’
- **random_state** – initial random seed for the sampling process, for reproducible research
- **stem_order** – how many stem characters per data point to display, defaults to 1
- **stem_skip** – how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter
- **stop_words** – stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
Returns

stemgraphic.alpha.heatmap_grid(src1, src2, src3=None, src4=None, alpha_only=True, annot=False, caps=False, center=0, cmap=None, display=1000, leaf_order=1, leaf_skip=0, random_state=None, reverse=False, robust=False, stem_order=1, stem_skip=0, stop_words=None, threshold=0)

heatmap_grid.

With stem_graphic, it is possible to directly compare two different sources. In the case of a heatmap, two different data sets cannot be visualized directly on a single heatmap. For this task, we designed heatmap_grid to adapt to the number of sources to build a layout. It can take from 2 to 4 different source.

With 2 sources, a square grid will be generated, allowing for horizontal and vertical comparisons, with an extra heatmap showing the difference between the two matrices. It also computes a norm for that difference matrix. The smaller the value, the closer the two heatmaps are.

With 3 sources, it builds a triangular grid, with each source heatmap in a corner and the difference between each pair in between.

Finally, with 4 sources, a 3 x 3 grid is built, each source in a corner and the difference between each pair in between, with the center expressing the difference between top left and bottom right diagonal.

Parameters

- **src1** – string, filename, url, list, numpy array, time series, pandas or dask dataframe (required)
- **src2** – string, filename, url, list, numpy array, time series, pandas or dask dataframe (required)
- **src3** – string, filename, url, list, numpy array, time series, pandas or dask dataframe (optional)
- **src4** – string, filename, url, list, numpy array, time series, pandas or dask dataframe (optional)
- **alpha_only** – only use stems from a-z alphabet
- **annot** – display annotations (Z) on heatmap
- **caps** – bool, True to be case sensitive, defaults to False, recommended for comparisons.
- **center** – the center of the divergent color map for the difference heatmaps
- **cmap** – color map for difference heatmap or None (default) to use the builtin red / blue divergent map
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **leaf_order** – how many leaf characters per data point to display, defaults to 1
- **leaf_skip** – how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: 'wol','wor','woo'
- **robust** – reduce effect of outliers on difference heatmap
- **random_state** – initial random seed for the sampling process, for reproducible research
- **stem_order** – how many stem characters per data point to display, defaults to 1
- **stem_skip** – how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter
• **stop_words** – stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)

• **threshold** – absolute value minimum count difference for a difference heatmap element to be visible

**Returns**

stemgraphic.alpha.matrix_difference(mat1, mat2, thresh=0, ord=None)

**Parameters**

• **mat1** – first heatmap dataframe

• **mat2** – second heatmap dataframe

• **thresh** – absolute value minimum count difference for a difference heatmap element to be visible

**Returns** difference matrix, norm and ratio of the sum of the first matrix over the second

stemgraphic.alpha.ngram_data(df, alpha_only=False, ascending=True, binary=False, break_on=None, caps=False, char_filter=None, column=None, compact=False, display=750, leaf_order=1, leaf_skip=0, persistence=None, random_state=None, remove_accents=False, reverse=False, rows_only=True, sort_by='len', stem_order=1, stem_skip=0, stop_words=None)

This is the main text ingestion function for stemgraphic.alpha. It is used by most of the visualizations. It can also be used directly, to feed a pipeline, for example.

If selected (rows_only=False), the returned dataframe includes in each row a single word, the stem, the leaf and the ngram (stem + leaf) - the index is the ‘token’ position in the original source:

word stem leaf ngram

12 salut s a sa 13 chéri c h ch

**Parameters**

• **df** – list, numpy array, series, pandas or dask dataframe

• **alpha_only** – only use stems from a-z alphabet (NA on dataframe)

• **ascending** – bool if the sort is ascending

• **binary** – bool if True forces counts to 1 for anything greater than 0

• **break_on** – letter on which to break a row, or None (default)

• **caps** – bool, True to be case sensitive, defaults to False, recommended for comparisons. (NA on dataframe)

• **char_filter** – list of characters to ignore. If None (default) CHAR_FILTER list will be used

• **column** – specify which column (string or number) of the dataframe to use, or group of columns (stems) else the frame is assumed to only have one column with words.

• **compact** – remove empty stems

• **display** – maximum number of data points to display, forces sampling if smaller than len(df)

• **leaf_order** – how many leaf characters per data point to display, defaults to 1

• **leaf_skip** – how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: ‘wol’, ‘wor’, ‘woo’
• **persistence** – will save the sampled DataFrame to filename (with csv or pkl extension) or None
• **random_state** – initial random seed for the sampling process, for reproducible research
• **remove_accents** – bool if True strips accents (NA on DataFrame)
• **rows_only** – bool by default returns only the stem and leaf rows. If false, also the matrix and DataFrame
• **sort_by** – default to ‘len’, can also be ‘alpha’
• **stem_order** – how many stem characters per data point to display, defaults to 1
• **stem_skip** – how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter
• **stop_words** – stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)

**Returns** ordered rows if rows_only, else also returns the matrix and DataFrame

**stemgraphic.alpha.plot_sunburst_level**(normalized, ax, label=True, level=0, offset=0, ngram=False, plot=True, stem=None, vis=0)

Utility function for sunburst function.

**Parameters**

• **normalized** –
• **ax** –
• **label** –
• **level** –
• **ngram** –
• **offset** –
• **plot** –
• **stem** –
• **vis** –

**Returns**

**stemgraphic.alpha.polar_word_plot**(ax, word, words, label, min_dist, max_dist, metric, offset, step)

Utility function for radar plot.

**Parameters**

• **ax** – matplotlib ax
• **word** – string, the reference word that will be placed in the middle
• **words** – list of words to compare
• **label** – bool if True display words centered at coordinate
• **min_dist** – minimum distance based on metric to include a word for display
• **max_dist** – maximum distance for a given section
• **metric** – any metric function accepting two values and returning that metric in a range from 0 to x
- **offset** – where to start plotting in degrees
- **step** – how many degrees to step between plots

**Returns**

stemgraphic.alpha.radar(`word`, `comparisons`, `ascending=True`, `display=100`, `label=True`, `metric=None`, `min_distance=1`, `max_distance=None`, `random_state=None`, `sort_by='alpha'`)

The radar plot compares a reference word with a corpus. By default, it calculates the levenshtein distance between the reference word and each words in the corpus. An alternate distance or metric function can be provided. Each word is then plotted around the center based on 3 criteria.

1. If the word length is longer, it is plotted on the left side, else on the right side.
2. Distance from center is based on the distance function.
3. the words are equidistant, and their order defined alphabetically or by count (only applicable if the corpus is a text and not a list of unique words, such as a password dictionary).

Stem-and-leaf support is upcoming.

**Parameters**

- **word** – string, the reference word that will be placed in the middle
- **comparisons** – external file, list or string or dataframe of words
- **ascending** – bool if the sort is ascending
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **label** – bool if True display words centered at coordinate
- **metric** – Levenshtein (default), or any metric function accepting two values and returning that metric
- **min_distance** – minimum distance based on metric to include a word for display
- **max_distance** – maximum distance based on metric to include a word for display
- **random_state** – initial random seed for the sampling process, for reproducible research
- **sort_by** – default to ‘alpha’, can also be ‘len’

**Returns**

stemgraphic.alpha.scatter(`src1`, `src2`, `src3=None`, `alpha=0.5`, `alpha_only=True`, `ascending=True`, `asFigure=False`, `ax=None`, `caps=False`, `compact=True`, `display=None`, `fig_xy=None`, `interactive=True`, `jitter=False`, `label=False`, `leaf_order=1`, `leaf_skip=0`, `log_scale=True`, `normalize=None`, `percentage=None`, `project=False`, `project_only=False`, `random_state=None`, `sort_by='alpha'`, `stem_order=1`, `stem_skip=0`, `stop_words=None`, `whole=False`)

With 2 sources:

Scatter compares the word frequency of two sources, on each axis. Each data point Z value is the word or stem-and-leaf value, while the X axis reflects that word/ngram count in one source and the Y axis reflect the same word/ngram count in the other source, in two different colors. If one word/ngram is more common on the first source it will be displayed in one color, and if it is more common in the second source, it will be displayed in a different color. The values that are the same for both sources will be displayed in a third color (default colors are blue, black and pink).

With 3 sources:
The scatter will compare in 3d the word frequency of three sources, on each axis. Each data point hover value is the word or stem-and-leaf value, while the X axis reflects that word/ngram count in the 1st source, the Y axis reflects the same word/ngram count in the 2nd source, and the Z axis the 3rd source, each in a different color. If one word/ngram is more common on the 1st source it will be displayed in one color, in the 2nd source as a second color and if it is more common in the 3rd source, it will be displayed in a third color. The values that are the same for both sources will be displayed in a 4th color (default colors are blue, black, purple and pink. 

In interactive mode, hovering the data point will give the precise counts on each axis along with the word itself, and filtering by category is done by clicking on the category in the legend. Double clicking a category will show only that category.

**Parameters**

- **src1** – string, filename, url, list, numpay array, time series, pandas or dask dataframe
- **src2** – string, filename, url, list, numpay array, time series, pandas or dask dataframe
- **src3** – string, filename, url, list, numpay array, time series, pandas or dask dataframe, optional

: param alpha:: opacity of the dots, defaults to 50% : param alpha_only:: only use stems from a-z alphabet (NA on dataframe) : param ascending:: word/stem count sorted in ascending order, defaults to True : param asFigure:: return plot as plotly figure (for web applications) : param ax:: matplotlib axes instance, usually from a figure or other plot : param caps:: bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe) : param compact:: do not display empty stem rows (with no leaves), defaults to False : param display:: maximum number of data points to display, forces sampling if smaller than len(df) : param fig_xy:: tuple for matplotlib figsize, defaults to (20,20) : param interactive:: if cufflinks is loaded, renders as interactive plot in notebook : param label:: bool if True display words centered at coordinate : param leaf_order:: how many leaf digits per data point to display, defaults to 1 : param leaf_skip:: how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: ‘wo’, ‘wor’, ‘woo’ : param log_scale:: bool if True (default) uses log scale axes (NA in 3d due to open issues with mpl, cufflinks) : param normalize:: bool if True normalize frequencies in src2 and src3 relative to src1 length : param percentage:: coordinates in percentage of maximum word/ngram count (in non interactive mode) : param project:: project src1/src2 and src1/src3 comparisons on X=0 and Z=0 planes : param project_only:: only show the projection (NA if project is False) : param random_state:: initial random seed for the sampling process, for reproducible research : param sort_by:: sort by ‘alpha’ (default) or ‘count’ : param stem_order:: how many stem characters per data point to display, defaults to 1 : param stem_skip:: how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter : param stop_words:: stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French) : param whole:: for normalized or percentage, use whole integer values (round) : return:: matplotlib ax, dataframe with categories

stemgraphic.alpha.stem_freq_plot(df, alpha_only=False, asFigure=False, column=None, compact=True, caps=False, display=2600, interactive=True, kind='barh', leaf_order=1, leaf_skip=0, random_state=None, stem_order=1, stem_skip=0, stop_words=None)

Word frequency plot is the most common visualization in NLP. In this version it supports stem-and-leaf / n-grams.

Each row is the stem, and similar leaves are grouped together and each different group is stacked in bar charts.

Default is horizontal bar chart, but vertical, histograms, area charts and even pie charts are supported by this one visualization.

**Parameters**

- **df** – string, filename, url, list, numpay array, time series, pandas or dask dataframe
- **alpha_only** – only use stems from a-z alphabet (NA on dataframe)
- **asFigure** – return plot as plotly figure (for web applications)
stemgraphic Documentation, Release 0.6.1

- **column** – specify which column (string or number) of the dataframe to use, or group of columns (stems) else the frame is assumed to only have one column with words.
- **compact** – do not display empty stem rows (with no leaves), defaults to False
- **caps** – bool, True to be case sensitive, defaults to False, recommended for comparisons (NA on dataframe)
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **interactive** – if cufflinks is loaded, renders as interactive plot in nebook
- **kind** – defaults to ‘barh’. One of ‘bar’, ‘barh’, ‘area’, ‘hist’. Non-interactive also supports ‘pie’
- **leaf_order** – how many leaf digits per data point to display, defaults to 1
- **leaf_skip** – how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: ‘wol’, ‘wor’, ‘woo’
- **random_state** – initial random seed for the sampling process, for reproducible research
- **stem_order** – how many stem characters per data point to display, defaults to 1
- **stem_skip** – how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter
- **stop_words** – stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)

Returns

```
stemgraphic.alpha.stem_graphic(df, df2=None, aggregation=True, alpha=0.1, alpha_only=True, ascending=False, ax=None, ax2=None, bar_color='C0', bar_outline=None, break_on=None, caps=True, column=None, combined=None, compact=False, delimiter_color='C3', display=750, figure_only=True, flip_axes=False, font_kw=None, leaf_color='k', leaf_order=1, leaf_skip=0, legend_pos='best', median_color='C4', mirror=False, persistence=None, primary_kw=None, random_state=None, remove_accents=False, reverse=False, secondary=False, show_stem=True, sort_by='len', stop_words=None, stem_order=1, stem_skip=0, title=None, trim_blank=False, underline_color=None)
```

The principal visualization of stemgraphic.alpha is stem_graphic. It offers all the options of stem_text (3.1) and adds automatic title, mirroring, flipping of axes, export (to pdf, svg, png, through fig.savefig) and many more options to change the visual appearance of the plot (font size, color, background color, underlining and more).

By providing a secondary text source, the plot will enable comparison through a back-to-back display

**Parameters**

- **df** – string, filename, url, list, numpy array, time series, pandas or dask dataframe
- **df2** – string, filename, url, list, numpy array, time series, pandas or dask dataframe (optional). for back 2 back stem-and-leaf plots
- **aggregation** – Boolean for sum, else specify function
- **alpha** – opacity of the bars, median and outliers, defaults to 10%
- **alpha_only** – only use stems from a-z alphabet (NA on dataframe)
- **ascending** – stem sorted in ascending order, defaults to True
• **ax** – matplotlib axes instance, usually from a figure or other plot
• **ax2** – matplotlib axes instance, usually from a figure or other plot for back to back
• **bar_color** – the fill color of the bar representing the leaves
• **bar_outline** – the outline color of the bar representing the leaves
• **break_on** – force a break of the leaves at that letter, the rest of the leaves will appear on the next line
• **caps** – bool, True to be case sensitive, defaults to False, recommended for comparisons (NA on dataframe)
• **column** – specify which column (string or number) of the dataframe to use, or group of columns (stems) else the frame is assumed to only have one column with words.
• **combined** – list (specific subset to automatically include, say, for comparisons), or None
• **compact** – do not display empty stem rows (with no leaves), defaults to False
• **delimiter_color** – color of the line between aggregate and stem and stem and leaf
• **display** – maximum number of data points to display, forces sampling if smaller than len(df)
• **figure_only** – bool if True (default) returns matplotlib (fig,ax), False returns (fig,ax,df)
• **flip_axes** – X becomes Y and Y becomes X
• **font_kw** – keyword dictionary, font parameters
• **leaf_color** – font color of the leaves
• **leaf_order** – how many leaf digits per data point to display, defaults to 1
• **leaf_skip** – how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: ‘wol’, ‘wor’, ‘woo’
• **legend_pos** – One of ‘top’, ‘bottom’, ‘best’ or None, defaults to ‘best’.
• **median_color** – color of the box representing the median
• **mirror** – mirror the plot in the axis of the delimiters
• **persistence** – filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
• **primary_kw** – stem-and-leaf plot additional arguments
• **random_state** – initial random seed for the sampling process, for reproducible research
• **remove_accents** – bool if True strips accents (NA on dataframe)
• **reverse** – bool if True look at words from right to left
• **secondary** – bool if True, this is a secondary plot - mostly used for back-to-back plots
• **show_stem** – bool if True (default) displays the stems
• **sort_by** – default to ‘len’, can also be ‘alpha’
• **stem_order** – how many stem characters per data point to display, defaults to 1
• **stem_skip** – how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter
• **stop_words** – stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
• title – string, or None. When None and source is a file, filename will be used.
• trim_blank – remove the blank between the delimiter and the first leaf, defaults to True
• underline_color – color of the horizontal line under the leaves, None for no display

Returns matplotlib figure and axes instance, and dataframe if figure_only is False

stemgraphic.alpha.stem_scatter(src1, src2, src3=None, alpha=0.5, alpha_only=True, ascending=True, asFigure=False, ax=None, caps=False, compact=True, display=None, fig_xy=None, interactive=True, jitter=False, label=False, leaf_order=1, leaf_skip=0, log_scale=True, normalize=None, percentage=None, project=False, project_only=False, random_state=None, sort_by='alpha', stem_order=1, stem_skip=0, stop_words=None, whole=False)

stem_scatter compares the word frequency of two sources, on each axis. Each data point Z value is the word or stem-and-leaf value, while the X axis reflects that word/ngram count in one source and the Y axis reflect the same word/ngram count in the other source, in two different colors. If one word/ngram is more common on the first source it will be displayed in one color, and if it is more common in the second source, it will be displayed in a different color. The values that are the same for both sources will be displayed in a third color (default colors are blue, black and pink. In interactive mode, hovering the data point will give the precise counts on each axis along with the word itself, and filtering by category is done by clicking on the category in the legend.

Parameters

• src1 – string, filename, url, list, numpy array, time series, pandas or dask dataframe
• src2 – string, filename, url, list, numpy array, time series, pandas or dask dataframe
• src3 – string, filename, url, list, numpy array, time series, pandas or dask dataframe, optional

stemgraphic.alpha.stem_sunburst(words, alpha_only=True, ascending=False, caps=False, compact=True, display=None, hole=True, label=True, leaf_order=1, leaf_skip=0, median=True, ngram=False, random_state=None, sort_by='alpha', statistics=True, stem_order=1, stem_skip=0, stop_words=None, whole=0)

Stem-and-leaf based sunburst. See sunburst for details

Parameters
Tukey’s original stem-and-leaf plot was text, with a vertical delimiter to separate stem from leaves. Just as stemgraphic implements a text version of the plot for numbers, stemgraphic.alpha implements a text version for words. This type of plot serves a similar purpose as a stacked bar chart with each data point annotated.

It also displays some basic statistics on the whole text (or subset if using column).

Parameters

- **df** – list, numpy array, time series, pandas or dask dataframe
- **aggr** – bool if True display the aggregated count of leaves by row
- **alpha_only** – only use stems from a-z alphabet (NA on dataframe)
- **ascending** – bool if the sort is ascending

Returns

stemgraphic.alpha.stem_text

Tukey’s original stem-and-leaf plot was text, with a vertical delimiter to separate stem from leaves. Just as stemgraphic implements a text version of the plot for numbers, stemgraphic.alpha implements a text version for words. This type of plot serves a similar purpose as a stacked bar chart with each data point annotated.

It also displays some basic statistics on the whole text (or subset if using column).
stemgraphic Documentation, Release 0.6.1

- **binary** – bool if True forces counts to 1 for anything greater than 0
- **break_on** – force a break of the leaves at that letter, the rest of the leaves will appear on the next line
- **caps** – bool, True to be case sensitive, defaults to False, recommended for comparisons (NA on dataframe)
- **column** – specify which column (string or number) of the dataframe to use, or group of columns (stems) else the frame is assumed to only have one column with words.
- **compact** – do not display empty stem rows (with no leaves), defaults to False
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **leaf_order** – how many leaf characters per data point to display, defaults to 1
- **leaf_skip** – how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: ‘wol’, ‘wor’, ‘woo’
- **legend_pos** – where to put the legend: ‘top’ (default), ‘bottom’ or None
- **persistence** – will save the sampled dataframe to filename (with csv or pkl extension) or None
- **random_state** – initial random seed for the sampling process, for reproducible research
- **remove_accents** – bool if True strips accents (NA on dataframe)
- **reverse** – bool if True look at words from right to left
- **rows_only** – by default returns only the stem and leaf rows. If false, also return the matrix and dataframe
- **sort_by** – default to ‘len’, can also be ‘alpha’
- **stem_order** – how many stem characters per data point to display, defaults to 1
- **stem_skip** – how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter
- **stop_words** – stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)

```python
code
stemgraphic.alpha.sunburst(words, alpha_only=True, ascending=False, caps=False, compact=True, display=None, hole=True, label=True, leaf_order=1, leaf_skip=0, median=True, ngram=True, random_state=None, sort_by='alpha', statistics=True, stem_order=1, stem_skip=0, stop_words=None, top=40)
```

Word sunburst charts are similar to pie or donut charts, but add some statistics in the middle of the chart, including the percentage of total words targeted for a given number of unique words (ie. top 50 words, 48% coverage).

With stem-and-leaf, the first level of the sunburst represents the stem and the second level subdivides each stem by leaves.

**Parameters**

- **words** – string, filename, url, list, numpy array, time series, pandas or dask dataframe
- **alpha_only** – only use stems from a-z alphabet (NA on dataframe)
- **ascending** – stem sorted in ascending order, defaults to True
stemgraphic Documentation, Release 0.6.1

- **caps** – bool, True to be case sensitive, defaults to False, recommended for comparisons. (NA on dataframe)
- **compact** – do not display empty stem rows (with no leaves), defaults to False
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **hole** – bool if True (default) leave space in middle for statistics
- **label** – bool if True display words centered at coordinate
- **leaf_order** – how many leaf digits per data point to display, defaults to 1
- **leaf_skip** – how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: ‘wol’, ‘wor’, ‘woo’
- **median** – bool if True (default) display an origin and a median mark
- **ngram** – bool if True (default) display full n-gram as leaf label
- **random_state** – initial random seed for the sampling process, for reproducible research
- **statistics** – bool if True (default) displays statistics in center - hole has to be True
- **sort_by** – sort by ‘alpha’ (default) or ‘count’
- **stem_order** – how many stem characters per data point to display, defaults to 1
- **stem_skip** – how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter
- **stop_words** – stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
- **top** – how many different words to count by order frequency. If negative, this will be the least frequent

**Returns** matplotlib polar ax, dataframe

`stemgraphic.alpha.word_freq_plot(src, alpha_only=False, ascending=False, asFigure=False, caps=False, display=None, interactive=True, kind='barh', random_state=None, sort_by='count', stop_words=None, top=100)`

word frequency bar chart.

This function creates a classical word frequency bar chart.

**Parameters**

- **src** – Either a filename including path, a url or a ready to process text in a dataframe or a tokenized format.
- **alpha_only** – words only if True, words and numbers if False
- **ascending** – stem sorted in ascending order, defaults to True
- **asFigure** – if interactive, the function will return a plotly figure instead of a matplotlib ax
- **caps** – keep capitalization (True, False)
- **display** – if specified, sample that quantity of words
- **interactive** – interactive graphic (True, False)
- **kind** – horizontal bar chart (barh) - also ‘bar’, ‘area’, ‘hist’ and non interactive ‘kde’ and ‘pie’
- **random_state** – initial random seed for the sampling process, for reproducible research
- **sort_by** – default to ‘count’, can also be ‘alpha’
- **stop_words** – a list of words to ignore
- **top** – how many different words to count by order frequency. If negative, this will be the least frequent

**Returns** text as dataframe and plotly figure or matplotlib ax

```python
calendar.alpha.word_radar(word, comparisons, ascending=True, display=100, label=True, metric=None, min_distance=1, max_distance=None, random_state=None, sort_by='alpha')
```

Radar plot based on words. Currently, the only type of radar plot supported. See ‘radar’ for more detail.

**Parameters**

- **word** – string, the reference word that will be placed in the middle
- **comparisons** – external file, list or string or dataframe of words
- **ascending** – bool if the sort is ascending
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **label** – bool if True display words centered at coordinate
- **metric** – any metric function accepting two values and returning that metric in a range from 0 to x
- **min_distance** – minimum distance based on metric to include a word for display
- **max_distance** – maximum distance based on metric to include a word for display
- **random_state** – initial random seed for the sampling process, for reproducible research
- **sort_by** – default to ‘alpha’, can also be ‘len’

**Returns**

```python
calendar.alpha.word_scatter(src1, src2, src3=None, alpha=0.5, alpha_only=True, ascending=True, asFigure=False, ax=None, caps=False, compact=True, display=None, fig_xy=None, interactive=True, jitter=False, label=False, leaf_order=None, leaf_skip=0, log_scale=True, normalize=None, percentage=None, random_state=None, sort_by='alpha', stem_order=None, stem_skip=0, stop_words=None, whole=False)
```

Scatter compares the word frequency of two sources, on each axis. Each data point Z value is the word or stem-and-leaf value, while the X axis reflects that word count in one source and the Y axis reflects the same word count in the other source, in two different colors. If one word is more common on the first source it will be displayed in one color, and if it is more common in the second source, it will be displayed in a different color. The values that are the same for both sources will be displayed in a third color (default colors are blue, black and pink. In interactive mode, hovering the data point will give the precise counts on each axis along with the word itself, and filtering by category is done by clicking on the category in the legend.

**Parameters**

- **src1** – string, filename, url, list, numpy array, time series, pandas or dask dataframe
- **src2** – string, filename, url, list, numpy array, time series, pandas or dask dataframe
- **src3** – string, filename, url, list, numpy array, time series, pandas or dask dataframe, optional
• **alpha** – opacity of the bars, median and outliers, defaults to 10%
• **alpha_only** – only use stems from a-z alphabet (NA on dataframe)
• **ascending** – stem sorted in ascending order, defaults to True
• **asFigure** – return plot as plotly figure (for web applications)
• **ax** – matplotlib axes instance, usually from a figure or other plot
• **caps** – bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)
• **compact** – do not display empty stem rows (with no leaves), defaults to False
• **display** – maximum number of data points to display, forces sampling if smaller than len(df)
• **fig_xy** – tuple for matplotlib figsize, defaults to (20,20)
• **interactive** – if cufflinks is loaded, renders as interactive plot in notebook
• **jitter** – random noise added to help see multiple data points sharing the same coordinate
• **label** – bool if True display words centered at coordinate
• **leaf_order** – how many leaf digits per data point to display, defaults to 1
• **leaf_skip** – how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: ‘wol’, ‘wor’, ‘woo’
• **log_scale** – bool if True (default) uses log scale axes
• **random_state** – initial random seed for the sampling process, for reproducible research
• **sort_by** – sort by ‘alpha’ or ‘count’ (default)
• **stem_order** – how many stem characters per data point to display, defaults to 1
• **stem_skip** – how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter
• **stop_words** – stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
• **whole** – for normalized or percentage, use whole integer values (round)

**Returns** matplotlib polar ax, dataframe

```
stemgraphic.alpha.word_sunburst(words, alpha_only=True, ascending=False, caps=False, compact=True, display=None, hole=True, label=True, leaf_order=None, leaf_skip=0, median=True, ngram=True, random_state=None, sort_by='alpha', statistics=True, stem_order=None, stem_skip=0, stop_words=None, top=40)
```

Word based sunburst. See sunburst for details

**Parameters**

• **words** – string, filename, url, list, numpy array, time series, pandas or dask dataframe
• **alpha_only** – only use stems from a-z alphabet (NA on dataframe)
• **ascending** – stem sorted in ascending order, defaults to True
• **caps** – bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)
• **compact** – do not display empty stem rows (with no leaves), defaults to False
stemgraphic Documentation, Release 0.6.1

- **display** – maximum number of data points to display, forces sampling if smaller than \( \text{len(df)} \)
- **hole** – bool if True (default) leave space in middle for statistics
- **label** – bool if True display words centered at coordinate
- **leaf_order** – how many leaf digits per data point to display, defaults to 1
- **leaf_skip** – how many leaf characters to skip, defaults to 0 - useful with shared bigrams: ‘wol’, ‘wor’, ‘woo’
- **median** – bool if True (default) display an origin and a median mark
- **ngram** – bool if True (default) display full n-gram as leaf label
- **random_state** – initial random seed for the sampling process, for reproducible research
- **statistics** – bool if True (default) displays statistics in center - hole has to be True
- **sort_by** – sort by ‘alpha’ (default) or ‘count’
- **stem_order** – how many stem characters per data point to display, defaults to 1
- **stem_skip** – how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter
- **stop_words** – stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
- **top** – how many different words to count by order frequency. If negative, this will be the least frequent

**Returns**

### 8.4 graphic

Stemgraphic provides a complete set of functions to handle everything related to stem-and-leaf plots. Stemgraphic.graphic is a module implementing a graphical stem-and-leaf plot function and a stem-and-leaf heatmap plot function for numerical data.

```python
stemgraphic.graphic.density_plot(df, var=None, ax=None, bins=None, box=None, density=True, density_fill=True, display=1000, fig_only=True, fit=None, hist=None, hues=None, hue_labels=None, jitter=None, kind=None, leaf_order=1, legend=True, limit_var=False, norm_hist=None, random_state=None, rug=None, scale=None, singular=True, strip=None, swarm=None, title=None, violin=None, x_min=0, x_max=None, y_axis_label=True)
```

density_plot.

Various density and distribution plots conveniently packaged into one function. Density plot normally forces tails at each end which might go beyond the data. To force min/max to be driven by the data, use limit_var. To specify min and max use x_min and x_max instead. Nota Bene: defaults to _decimation_ and _quantization_ mode.

See density_plot notebook for examples of the different combinations of plots.

Why this instead of seaborn:
Stem-and-leaf plots naturally quantize data. The amount of loss is based on scale and leaf_order and on the data itself. This function which wraps several seaborn distribution plots was added in order to compare various measures of density and distributions based on various levels of decimation (sampling, set through display) and of quantization (set through scale and leaf_order). Also, there is no option in seaborn to fill the area under the curve.

Parameters

- **df** – list, numpy array, time series, pandas or dask dataframe
- **var** – variable to plot, required if df is a dataframe
- **ax** – matplotlib axes instance, usually from a figure or other plot
- **bins** – Specification of hist bins, or None to use Freedman-Diaconis rule
- **box** – bool, if True plots a box plot. Similar to using violin, use one or the other
- **density** – bool, if True (default) plots a density plot
- **density_fill** – bool, if True (default) fill the area under the density curve
- **display** – maximum number rows to use (1000 default) for calculations, forces sampling if < len(df)
- **fig_only** – bool, if True (default) returns fig, ax, else returns fix, ax, max_peak, true_min, true_max
- **fit** – object with fit method, returning a tuple that can be passed to a pdf method
- **hist** – bool, if True plot a histogram
- **hues** – optional, a categorical variable for multiple plots
- **hue_labels** – optional, if using a column that is an object and/or categorical needing translation
- **jitter** – for strip plots only, add jitter. strip + jitter is similar to using swarm, use one or the other
- **leaf_order** – the order of magnitude of the leaf. The higher the order, the less quantization.
- **legend** – bool, if True plots a legend
- **limit_var** – use min / max from the data, not density plot
- **norm_hist** – bool, if True histogram will be normed
- **random_state** – initial random seed for the sampling process, for reproducible research
- **rug** – bool, if True plot a rug plot
- **scale** – force a specific scale for building the plot. Defaults to None (automatic).
- **singular** – force display of a density plot using a singular value, by simulating values of each side
- **strip** – bool, if True displays a strip plot
- **swarm** – swarm plot, similar to strip plot. use one or the other
- **title** – if present, adds a title to the plot
- **violin** – bool, if True plots a violin plot. Similar to using box, use one or the other
- **x_min** – force X axis minimum value. See also limit_var
• **x_max** – force Y axis minimum value. See also limit_var

• **y_axis_label** – bool, if True displays y axis ticks and label

**Returns** see fig_only

```
stemgraphic.graphic.heatmap(df, annotate=False, asFigure=False, ax=None, column=None, compact=False, display=900, interactive=True, leaf_order=1, persistence=None, random_state=None, scale=None, trim=False, trim_blank=True, unit='', zoom=None)
```

The heatmap displays the same underlying data as the stem-and-leaf plot, but instead of stacking the leaves, they are left in their respective columns. Row ‘42’ and Column ‘7’ would have the count of numbers starting with ‘427’ of the given scale.

The heatmap is useful to look at patterns. For distribution, stem_graphic is better suited.

**Parameters**

- **df** – list, numpy array, time series, pandas or dask dataframe
- **annotate** – display annotations (Z) on heatmap
- **asFigure** – return plot as plotly figure (for web applications)
- **ax** – matplotlib axes instance, usually from a figure or other plot
- **column** – specify which column (string or number) of the dataframe to use, else the first numerical is selected
- **compact** – do not display empty stem rows (with no leaves), defaults to False
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **interactive** – if cufflinks is loaded, renders as interactive plot in notebook
- **leaf_order** – how many leaf digits per data point to display, defaults to 1
- **persistence** – filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- **random_state** – initial random seed for the sampling process, for reproducible research
- **scale** – force a specific scale for building the plot. Defaults to None (automatic).
- **trim** – ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- **trim_blank** – remove the blank between the delimiter and the first leaf, defaults to True
- **unit** – specify a string for the unit (‘$’, ‘Kg’…). Used for outliers and for legend, defaults to ‘
- **zoom** – zoom level, on top of calculated scale (+1, -1 etc)

**Returns** count matrix, scale and matplotlib ax or figure if interactive and asFigure are True
stemgraphic.graphic.stem_graphic(df, df2=None, aggregation=True, alpha=0.1, asc=True, ax=None, ax2=None, bar_color='C0', bar_outline=None, break_on=None, column=None, combined=None, compact=False, delimiter_color='C3', display=900, figure_only=True, flip_axes=False, font_kw=None, leaf_color='k', leaf_order=1, legend_pos='best', median_alpha=0.25, median_color='C4', mirror=False, outliers=None, outliers_color='C3', persistence=None, primary_kw=None, random_state=None, scale=None, secondary=False, secondary_kw=None, secondary_plot=None, show_stem=True, title=None, trim=False, trim_blank=True, underline_color=None, unit='', zoom=None)

A graphical stem and leaf plot. stem_graphic provides horizontal, vertical or mirrored layouts, sorted in ascending or descending order, with sane default settings for the visuals, legend, median and outliers.

Parameters

- **df** – list, numpy array, time series, pandas or dask dataframe
- **df2** – string, filename, url, list, numpy array, time series, pandas or dask dataframe (optional). for back 2 back stem-and-leaf plots
- **aggregation** – Boolean for sum, else specify function
- **alpha** – opacity of the bars, median and outliers, defaults to 10%
- **asc** – stem sorted in ascending order, defaults to True
- **ax** – matplotlib axes instance, usually from a figure or other plot
- **ax2** – matplotlib axes instance, usually from a figure or other plot for back to back
- **bar_color** – the fill color of the bar representing the leaves
- **bar_outline** – the outline color of the bar representing the leaves
- **break_on** – force a break of the leaves at x in (5, 10), defaults to 10
- **column** – specify which column (string or number) of the dataframe to use, else the first numerical is selected
- **combined** – list (specific subset to automatically include, say, for comparisons), or None
- **compact** – do not display empty stem rows (with no leaves), defaults to False
- **delimiter_color** – color of the line between aggregate and stem and stem and leaf
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **figure_only** – bool if True (default) returns matplotlib (fig,ax), False returns (fig,ax,df)
- **flip_axes** – X becomes Y and Y becomes X
- **font_kw** – keyword dictionary, font parameters
- **leaf_color** – font color of the leaves
- **leaf_order** – how many leaf digits per data point to display, defaults to 1
- **legend_pos** – One of ‘top’, ‘bottom’, ‘best’ or None, defaults to ‘best’.
- **median_alpha** – opacity of median and outliers, defaults to 25%
- **median_color** – color of the box representing the median
- **mirror** – mirror the plot in the axis of the delimiters
• **outliers** – display outliers - these are from the full data set, not the sample. Defaults to Auto

• **outliers_color** – background color for the outlier boxes

• **persistence** – filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)

• **primary_kw** – stem-and-leaf plot additional arguments

• **random_state** – initial random seed for the sampling process, for reproducible research

• **scale** – force a specific scale for building the plot. Defaults to None (automatic).

• **secondary** – bool if True, this is a secondary plot - mostly used for back-to-back plots

• **secondary_kw** – any matplotlib keyword supported by .plot(), for the secondary plot

• **secondary_plot** – One or more of ‘dot’, ‘kde’, ‘margin_kde’, ‘rug’ in a comma delimited string or None

• **show_stem** – bool if True (default) displays the stems

• **title** – string to display as title

• **trim** – ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None

• **trim_blank** – remove the blank between the delimiter and the first leaf, defaults to True

• **underline_color** – color of the horizontal line under the leaves, None for no display

• **unit** – specify a string for the unit (‘$’, ‘Kg’...). Used for outliers and for legend, defaults to ‘’

• **zoom** – zoom level, on top of calculated scale (+1, -1 etc)

**Returns** matplotlib figure and axes instance

### 8.5 helpers

`helpers.py`

Helper functions for stemgraphic.

```python
stemgraphic.helpers.APOSTROPHE = '’'
    # Typographical apostrophe - ex: I’m, l’arbre

stemgraphic.helpers.CHAR_FILTER = [\t', '\n', '\\', '/', '\',('*', '_','{','}','[',']','[',']','[',']','[',']')
    # Characters to filter. Does a relatively good job on a majority of texts ‘-’ and ‘–’ is to skip quotes in many plays
    # and dialogues in books, especially French.

stemgraphic.helpers.DOUBLE_QUOTE = '"'
    # Double straight quote mark

stemgraphic.helpers.EMPTY = b''
    # empty

stemgraphic.helpers.LETTERS = 'abcdefghijklmnopqrstuvwxyz'
    # Default definition of standard letters remove_accent has to be called explicitely for any of these letters to match
    # their accented counterparts
```
List of non alpha characters. Temporary - I want to balance flexibility with convenience, but still looking at options.

Similar purpose to CHAR_FILTER, ut keeps the period. The last word of each sentence will end with a ‘.’ Useful for manipulating the dataframe returned by the various visualizations and ngram_data, to break down frequencies by sentence instead of the full text or list.

Temporary - I want to balance flexibility with convenience, but still looking at options.

Useful for manipulating the dataframe returned by the various visualizations and ngram_data, to break down frequencies by sentence instead of the full text or list.

for typesetting overlap

Straight quote mark - ex: ‘INCONCEIVABLE’

Calculates a value from a stem, a leaf and a scale.

Parameters

- stem
- leaf
- scale

Returns calculated values

Builds a graphical legend for numerical stem-and-leaf plots.

Parameters

- display
- cur_font
- ax
- x
- y
- pos
- asc
- flip_axes
- mirror
- stem
- leaf
- scale
- delimiter_color
- unit
- aggregation

Handles min, max and count. This works on numpy, lists, pandas and dask dataframes.
• `column` –
  • `x` – list, numpy array, series, pandas or dask dataframe

**Returns** min, max and count

```
stemgraphic.helpers.percentile(data, alpha)
```

**Parameters**

- **data** – list, numpy array, time series or pandas dataframe
- **alpha** – between 0 and 0.5 proportion to select on each side of the distribution

**Returns** the actual value at that percentile

```
stemgraphic.helpers.stack_columns(row)
```

stack multiple columns into a single stacked value :param row: a row of letters :return: stacked string

### 8.6 num

stemgraphic.num.

BRAND NEW in V.0.5.0!

Stemgraphic provides a complete set of functions to handle everything related to stem-and-leaf plots. num is a module of the stemgraphic package to handle numerical variables.

This module structure is new as of v.0.5.0 to match the addition of stemgraphic.alpha.

The shorthand from previous versions of stemgraphic is still available and defaults to the numerical functions:

```python
from stemgraphic import stem_graphic, stem_text, heatmap
```

### 8.7 stopwords

stopwords

This module includes 4 lists of stop words: EN (main English list), ALT_EN (alternate English list), FR (French) and SP (Spanish).

A PT (Portuguese) list is in the works.

```
stemgraphic.stopwords.AL_T_EN = ['a', 'am', 'an', 'and', 'are', 'as', 'at', 'been', 'for', 'is', 'of', 'on', 'or', 'out', 'so', 'such', 'the', 'these', 'this', 'those', 'to', 'upon', 'was', 'were']
```

**ALT English stop words**

```
stemgraphic.stopwords.EN = ['a', 'about', 'above', 'across', 'after', 'afterwards', 'again', 'all', ...
```

**ENglish stop words**

```
stemgraphic.stopwords.ES = ['a', 'alguna', 'algunas', 'alguno', 'algunos', 'algún', 'ambas', 'ambos', ...
```

**Spanish (ESpanol) stop words**

```
stemgraphic.stopwords.FR = ['a', 'alors', 'au', 'aucuns', 'aussi', 'autre', 'autres', 'aux', ...
```

**French (FRancais) stop words**

```
stemgraphic.stopwords.VOCALES = ['a', 'á', 'e', 'é', 'í', 'í', 'o', 'ó', 'u', 'û', 'ü']
```

**Spanish vowels**

```
stemgraphic.stopwords.VOWELS = ['a', 'e', 'i', 'o', 'u']
```

**English vowels**
stemgraphic.stopwords.VOYELLES = ['a', 'â', 'ä', 'à', 'æ', 'e', 'ê', 'ë', 'é', 'è', 'i', 'î', 'ï', 'o', 'ô', 'ö', 'œ', 'u', 'û', 'ü', 'ù', 'y']

French vowels

8.8 text

stemgraphic.text.quantize(df, column=None, display=750, leaf_order=1, random_state=None, scale=None, trim=None, zoom=None)

Converts a series into stem-and-leaf and back into decimal. This has the potential effect of decimating (or truncating) values in a lossy way.

Parameters

- **df** – list, numpy array, time series, pandas or dask dataframe
- **column** – specify which column (string or number) of the dataframe to use, else the first numerical is selected
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **leaf_order** – how many leaf digits per data point to display, defaults to 1
- **random_state** – initial random seed for the sampling process, for reproducible research
- **scale** – force a specific scale for building the plot. Defaults to None (automatic).
- **trim** – ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- **zoom** – zoom level, on top of calculated scale (+1, -1 etc)

Returns decimated df

stemgraphic.text.stem_data(x, break_on=None, column=None, compact=False, display=300, full=False, leaf_order=1, omin=None, omax=None, outliers=False, persistence=None, random_state=None, scale=None, total_rows=None, trim=False, zoom=None)

Returns scale factor, key label and list of rows.

Parameters

- **x** – list, numpy array, time series, pandas or dask dataframe
- **break_on** – force a break of the leaves at x in (5, 10), defaults to 10
- **column** – specify which column (string or number) of the dataframe to use, else the first numerical is selected
- **compact** – do not display empty stem rows (with no leaves), defaults to False
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **full** – bool, if True returns all interim results including sorted data and stems
- **leaf_order** – how many leaf digits per data point to display, defaults to 1
- **outliers** – display outliers - these are from the full data set, not the sample. Defaults to Auto
- **omin** – float, if already calculated, helps speed up the process for large data sets
- **omax** – float, if already calculated, helps speed up the process for large data sets
stemgraphic Documentation, Release 0.6.1

- **persistence** – persist sampled dataframe
- **random_state** – initial random seed for the sampling process, for reproducible research
- **scale** – force a specific scale for building the plot. Defaults to None (automatic)
- **total_rows** – int, if already calculated, helps speed up the process for large data sets
- **trim** – ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- **zoom** – zoom level, on top of calculated scale (+1, -1 etc)

```
stemgraphic.text.stem_dot(df, asc=True, break_on=None, column=None, compact=False, display=300, leaf_order=1, legend_pos='best', marker=None, outliers=True, random_state=None, scale=None, trim=False, unit='', zoom=None)
```

**Parameters**

- **df** – list, numpy array, time series, pandas or dask dataframe
- **asc** – stem sorted in ascending order, defaults to True
- **break_on** – force a break of the leaves at x in (5, 10), defaults to 10
- **column** – specify which column (string or number) of the dataframe to use, else the first numerical is selected
- **compact** – do not display empty stem rows (with no leaves), defaults to False
- **display** – maximum number of data points to display, forces sampling if smaller than len(df)
- **legend_pos** – One of ‘top’, ‘bottom’, ‘best’ or None, defaults to ‘best’.
- **marker** – char, symbol to use as marker. ‘O’ is default. Suggested alternatives: ‘*’, ‘+’, ‘x’, ‘.’, ‘o’
- **outliers** – display outliers - these are from the full data set, not the sample. Defaults to Auto
- **random_state** – initial random seed for the sampling process, for reproducible research
- **scale** – force a specific scale for building the plot. Defaults to None (automatic).
- **trim** – ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- **unit** – specify a string for the unit (‘$', ‘Kg’...). Used for outliers and for legend, defaults to ‘’
- **zoom** – zoom level, on top of calculated scale (+1, -1 etc)

```
stemgraphic.text.stem_text(df, asc=True, break_on=None, column=None, compact=False, display=300, legend_pos='best', outliers=True, persistence=None, random_state=None, scale=None, trim=False, unit='', zoom=None)
```

**Parameters**

- **df** – list, numpy array, time series, pandas or dask dataframe
- **asc** – stem sorted in ascending order, defaults to True
- **break_on** – force a break of the leaves at x in (5, 10), defaults to 10
- **column** – specify which column (string or number) of the dataframe to use, else the first numerical is selected
• **compact** – do not display empty stem rows (with no leaves), defaults to False

• **display** – maximum number of data points to display, forces sampling if smaller than len(df)

• **legend_pos** – One of ‘top’, ‘bottom’, ‘best’ or None, defaults to ‘best’.

• **outliers** – display outliers - these are from the full data set, not the sample. Defaults to Auto

• **persistence** – filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)

• **random_state** – initial random seed for the sampling process, for reproducible research

• **scale** – force a specific scale for building the plot. Defaults to None (automatic).

• **trim** – ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None

• **unit** – specify a string for the unit (‘$’, ‘Kg’...). Used for outliers and for legend, defaults to ‘’

• **zoom** – zoom level, on top of calculated scale (+1, -1 etc)
